

Ofman's Core Quadrant

What is it? Ofman's Core Quadrant is a model created by Daniel Ofman. It helps you understand yourself better by showing how your biggest strength can also be your biggest weakness. The idea is simple: if you take a good quality too far, it becomes a problem. It also explains why certain people or behaviors can really annoy you and what that says about yourself.

The 4 quadrants:

- Core quality -> Your natural strength. Something that comes naturally to you.
- Pitfall -> What happens when your core quality goes too far. It becomes too much.
- Challenge -> The opposite of your pitfall. Something you need to learn or develop.
- Allergy -> What annoys you in others. Usually someone who has too much of your challenge.

The interesting part is that your allergy is not random, it points directly at something you still need to grow in yourself.

Quadrant – Kyan

Core quality	I take a lot of initiative and I deliver work of high quality.
Pitfall	When people slack off I take their tasks on myself because I want them to be done on time and people can take advantage of that.
Challenge	Learning to rely on people when they say they do their work on time.
Allergy	People who don't do their work on time or makes no effort in doing the work.

Quadrant – Amir

Core quality	I am highly driven and reliable. I naturally take responsibility and maintain a strong "try-hard" work ethic to ensure my projects succeed.
Pitfall	I can become over-perfectionistic. When I push too hard, I may set unrealistic expectations for myself or become too demanding of others.
Challenge	I need to practice patience and healthy detachment. My goal is to stay committed to quality while accepting that I cannot control every detail.
Allergy	I am frustrated by passivity and lack of effort. I find it difficult to work with people who do not take accountability or show initiative.
